Search Notes

Attached please find the results of your prior art search. I have highlighted items of interest. Please feel free to contact me if you have additional questions or concerns.

EIC 3700 welcomes your feedback and would be particularly interested in knowing if you use any of these references in an office action. If you have a moment, please let us know which references you use.

Thank you and have a great day.

Selectively expandable spinal bone fixation screw-sleeve device...

Alerting Abstract ...Counters screw pull-out and reduces danger that

screw pull-out will destroy region of **bone** into which screw has been implanted.

Title Terms.../Index Terms/Additional Words: **BONE** ;

Original Publication Data by Authority

Original Abstracts:

The present invention is a selectively expandable **bone** fixation screw-sleeve **device** which provides substantially greater holding strength in human **bone** than other **bone screw** devices. The **sleeve** element of this invention includes several embodiments, each having at least one corresponding screw element for selectively expanding a portion of the sleeve once it has been inserted into the **bone** . More specifically, in **several** embodiments, the sleeve includes a series of vertical slots in the end, or ends, of...

Claims:

A selectively expandable **bone** fixation **screw** -sleeve device, comprising:an elongate member;an elongate cylindrical sleeve having an upper, a central...

...the interior surface;a plurality of radially aligned slots formed in said central portion, said **slots extending** from **the exterior** surface to the interior surface, each of said radially aligned slots connecting selected pairs of adjacent axially aligned slots;a **plurality of articulated sections** , defined between sequential twos of said axially aligned slots, said articulated sections comprising first, second...

Deproteinized bovine bone used as an adjunct to guided bone augmentation: an experimental study in the rat.

BACKGROUND: Promising results have been reported following treatment of periodontal and peri-implant **bone** defects with deproteinized bovine **bone** grafts, but their influence on **bone** formation has not been clarified.

PURPOSE: The goal of this study was to examine whether implantation of deproteinized bovine **bone** (Bio-Oss, Geistlich AG, Wolhusen, Switzerland) influences **bone** formation when used as an adjunct to guided **bone** augmentation (GBA). MATERIALS AND METHODS: A rigid, hemispherical, Teflon capsule was loosely packed with a...

... of 10 animals were sacrificed after 1, 2, and 4 months. The volumes of the **space created** by the capsule and of the (1) newly formed **bone**, (2) remaining Bio-Oss **particles**, (3) soft **connective** tissue, and (4) acellular space in the capsule were estimated by a point-counting technique in three or four histologic sections, taken by uniformly random sampling. RESULTS: **Bone** formation at 1 month was limited in both tests and controls. After 2 months, the mean volume of the newly formed **bone** occupied 9.0% of the **space created** by the capsule in the test specimens compared with 23.8% in the control specimens...

... It can be concluded that Bio-Oss, used as an adjunct to GBA, interferes with **bone** formation.

Fastener and method for bone fixation

ABSTRACT: A fastener for securing an osteosynthesis plate to a **plurality** of **bone segments** is provided. The **fastener** in the form of a fastener blank includes an elongated shank adapted for insertion through an opening in the plate and into a **hole formed** in the **bone**. The upper end of the shank forms a head that serves to secure the plate to the **bone**. The elongated shank is constructed of a material which when heated will deform to form a tight fit within the hole drilled in the **bone**. The fastener is preferably made of a resorbable material. The invention also provides a method for securing a plate to a **bone** using the fasteners of the invention. A fastener blank is positioned into the hole so that a portion of the blank extends into the hole provided in the **bone** and another portion overlies the plate. The blank is heated to raise the temperature of...

...ABSTRACT: control foals. At necropsy, focal segments of articular
cartilage were loose and broken in many **joints** throughout the skeleton.
In **some areas**, there was intracartilaginous separation, and in
others, there was complete breakage of fragments from the joint surface
of form free cartilaginous bodies in the joint **cavity**. In the lesions
formed early in the course of the experiment, a residual layer of
cartilage remained over the underlying **bone**. Also, cartilage of the
metaphyseal physis had broken. Hypoplastic and necrotic chondrocytes were
scattered among...
